

Opening Up New Real Estate Markets With Data Integrations

The Challenge

The client is a large real estate technology company that needed to enter several new markets. In order to integrate the data sources for each of the new markets reliably, significant custom work needed to be done. This required hands-on engineering talent that could assimilate the company's technical processes with the incoming data appropriately, managing either as required. The company was under pressure to enter these markets quickly, so the teams needed to be able to deliver efficiently and effectively.

The Solution

Eliassen Group delivered a team of talented software engineers with a particular eye for data quality and a good understanding of process improvement. The team onboarded the new markets quickly, found and improved upon best practices, and then educated the existing engineering teams on the new processes so they could take over. Our relationship with this client spans numerous successful and ongoing projects.

The Client

**National Real Estate
Technology Company**

Highlighted Results

- The delivered team successfully onboarded the target markets efficiently.
- Existing best practices were improved, and new best practices implemented.
